THE INVISIBLE TAX

How much money does your company lose by doing
things the way it has always done them?
In this guide you'll learn how to stop losing it.

A guide for managing directors

Almudena Gázquez

Scene 1 · At the office

It's 8:07 pm on a Monday.

The office is empty. All you can hear is the hum of the fluorescent light and the fan of a computer that has been on for hours. The coffee went cold a long time ago.

You're still there, with an eleven-tab Excel file. You copy a figure from the third to the sixth, compare it with another, check it again. Because an error in that file is found late, and the later it's found, the more it costs.

Scene 2 · At home

Saturday, 2:30 pm. Family lunch. Your youngest daughter is telling you something that happened at school, and you nod with one eye on your phone, face down next to your plate.

It buzzes. It's the head of logistics: your best customer received only 70% of their order (they were expecting it in full), and the invoice charges for the full order. The customer wants an explanation today.

You get up from the table. "Sorry, just a minute." It isn't a minute: it's forty minutes in the hallway, with your laptop open on the kitchen counter.

When you come back, the lunch is cold and your daughter has stopped telling you anything.

If either of these scenes sounds familiar, keep reading. They are very common.

Before you start

This guide takes about twenty-five minutes to read.

First, one small thing: get a piece of paper and a pen and keep them within reach. You'll use them in chapter 7.

Now, three quick questions, just for you:

- You know every figure in your company. Have you ever worked out how much money goes out each month on copying, searching and repeating?
- Is there anything in your company that's done a certain way because "it's always been done that way"?
- Would it help to have an hour a day, with the door closed and your phone on silent, to think calmly about your company's strategy, look for solutions and improvements, and stop putting out fires so you can start preventing them?

If you said yes to any of them, you're in the right place. You don't have to believe anything that follows: just check whether it rings true. Whatever doesn't fit your company, leave it.

1. What you already know

What you've just read isn't unusual. Almost every managing director of a company with a team goes through something similar. It isn't a lack of organisation or of willingness: it's what happens when a company grows and the work has to travel from hand to hand.

Take a closer look at two more scenes.

Scene 3 · The order that gets copied three times

An order comes in by email. One person copies it into the management system. Another copies it again into the planning spreadsheet. A third types it into the delivery note. The same number three times, written by three different hands, with the sound of keyboards in the background. Everyone does it carefully. But all it takes is for one digit to land in the wrong place, just once, and then you have to call the customer, undo, redo and apologise.

Scene 4 · What only one person knows

The quietest one. In your company there is a person who knows how that machine is set up, how that customer is invoiced with all their particular requirements, how the month is closed. It isn't written down anywhere. It's in their head and in a notebook nobody else can make sense of. It works wonderfully... until they go on holiday, fall ill or get a better offer.

Notice what the four scenes have in common: in none of them is anyone doing a bad job. These are hard-working, willing people who deliver. They are not the problem. The problem is the **road the work travels** between one pair of hands and the next, and what gets left behind along the way.

> The problem is almost never the people. It's the road the work travels between them.

Now, a simple question. If someone timed everything that gets copied, repeated, searched for and asked about in your company for a week, how many hours would come out? You don't need to answer. Just notice what your first number was.

That number has a price. And the price has a name. Nobody has ever put it in front of you, and that's why it's still there.

2. The invisible tax

One name was still missing.

It's called **the invisible tax**: what your company pays every day for doing things the way it has always done them.

It doesn't arrive in the post. It has no due date and no receipt. It's charged in hours: the ones someone spends copying, searching, asking, repeating. And it's charged in experience: the experience that walks out the door when someone retires, changes job or leaves your company. When an essential member of the team goes, it hurts, and a lot: their colleagues lose weeks covering a gap that nobody had written down anywhere. And because those hours are already inside every payslip, nobody approved them and nobody saw them go.

In your accounts there's a line for salaries, another for electricity, another for rent. There isn't one called "what it costs not to look". But it exists.

So change the sentence. Don't say "we're losing time". Say: **money is going out**.

Let's do the sums, with a real figure. What matters is your own hourly labour cost: what each real hour of a person's work costs your company, adding salary and employer contributions. Use the figure for your country. For this worked example we'll use the official figure for Spain (national statistics office, INE): **€26.18** per hour actually worked (second quarter of 2026).

So the sum doesn't get inflated, we'll keep it cautious:

- A day is 8 hours.
- A month is 16 days of effective work (the days actually worked on average, after deducting holidays, public holidays and sick leave).
- A year is 12 months.

One person, one task

Think of someone in administration who spends **2 hours a day** moving data from one place to another.

- Per day: 2 × €26.18 = **€52.36**
- Per month: €52.36 × 16 working days = **more than €837**
- Per year: €837.76 × 12 months = **more than €10,053**

More than ten thousand euros a year. For one person. For one task you may not even have counted as a task. Without a single invoice in between.

Say it slowly: ten thousand euros a year that vanish without anyone seeing them.

Time lost per day, per person	Per day	Per month	Per year
30 minutes	€13.09	€209	€2,513
1 hour	€26.18	€418	€5,026
2 hours	€52.36	€837	€10,053

Now multiply. If it isn't one person but five, and it isn't two hours but one, that's €130.90 a day. More than **€25,000 a year**. The price of a car, every year, without anyone having bought it.

The catch in this sum

It has a catch, and it's better that you see it now. This figure is what it **costs**, not what you **save**. What is lost today in a task doesn't disappear entirely when you improve it: part of the time will still be needed and part will move to something else. This is not a promise of savings. It's a way of seeing clearly the true weight of what you can't see today.

And it doesn't count the mistakes that have to be fixed afterwards, or the customer who gets tired of waiting, or what an hour of your own time spent thinking about next year would be worth.

> What isn't measured doesn't hurt. And what doesn't hurt, stays.

Now you know what it costs. And you're surely already thinking: "I've already tried to fix all this." You're right. Look at what happened with each attempt, because there's a piece missing there.

3. What you've already tried

You probably think you've tried everything.

And that's likely true. That's exactly why you're better placed than anyone: you know what hasn't worked. Let's go through it one by one, because it's worth seeing what they have in common.

More hours

If the work doesn't get done, you put in more hours. You arrive earlier, you leave later, you take the laptop home. For a while it works, because you can put up with a lot.

But hours don't change the road. They just make you travel it more times.

More people

If you're short of people, you hire. And if the first person didn't solve anything, you hire another one with more experience and better pay.

They join, learn how things are done and do them just like everyone else: with the same copying, the same spreadsheets and the same questions. Better CV, same road. A good professional put into a clumsy process soon becomes clumsy. Not for lack of talent.

A software package

Someone shows you one that looks fantastic. You pay for it, install it, and give a one-afternoon training session. Three months later, the team uses half the features and the rest is still in the same old spreadsheets, because "it didn't quite fit how we do this". One more tool to maintain and to pay for. Not to mention the time it takes to roll out and the fact that it probably can't connect to your main management system (the ERP): it ends up as an isolated system, one more island where the same data gets copied all over again.

A course

You come out with your head full of ideas and full of enthusiasm. On Monday your email, your phone and three urgent matters are waiting, and the ideas stay in the notebook. The course was about companies in general. Yours has its own routines and customs.

What they have in common

Four attempts that **add** something: hours, people, software, training. Against that, only one that **looks**: where exactly the work gets lost.

It's like going to the doctor, saying "it hurts" and leaving with a generic prescription for pain, without anyone having examined you. They might get it right, but usually they don't: the pill covers up the symptom for a while and the root of the problem is still there, untouched.

It's also like bailing out a boat with a bucket without having looked at where the water is coming in: you get tired and the water keeps coming in.

> Adding without first understanding where the work gets lost is covering up the symptom.

You haven't failed. You've done what any sensible managing director would have done with the information they had. And that's exactly why what's missing isn't effort. It's a piece nobody gave you.

That piece is hidden behind a sentence you've been hearing for years, and probably saying.

4. "It's always been done this way"

You know the sentence. You've said it, your partners have said it, your team, your suppliers. "I've been doing it this way for years."

And it makes all the sense in the world. When the company was smaller, doing things by hand was reasonable: few orders, few customers, everyone knew each other. If you needed a piece of information, you asked whoever was next to you. That way of working got you here. It deserves respect.

What has changed isn't how you work. It's the size of what passes through it. A road that handles ten orders a day jams up with a hundred. It's a country road that now carries the traffic of a city: the road isn't bad, it's just no longer the one you need.

So the question isn't whether you should change what worked. It's a smaller one: what if, before changing anything, you look, observe and analyse?

Because this isn't about changing. It's about **looking, observing and analysing before changing**. Looking at the numbers before deciding is what you do with everything else in your company. Do the same with this.

First, look at the road.

An idea to keep at hand

Companies either grow or shrink. They don't stand still. While you keep what works, the market and your competitors keep moving.

Put like that, it sounds like a threat. It's the opposite: it means a small change today weighs more than it seems. Meanwhile, the invisible tax keeps running. What's at stake is your Monday at 8:07 pm. What it takes is an afternoon and a piece of paper.

"AI isn't for me"

This is where many people close the book: "That's for young people, for technical people, for big companies." It's logical to think so. But it's worth separating three things:

- **It isn't for you to learn.** Just as you don't know how your car's engine works inside, you don't have to know how this works. It's at the service of your team: the people you already have are the ones who gain time.
- **You don't need to be technical.** Neither you nor your team. If you know how your company works, you already know the most important thing.
- **It doesn't replace anyone.** It removes tasks, not jobs: the repetitive ones, the ones nobody misses. What's left for people is what adds value: deciding, dealing with the customer, improving things.

And, in all honesty, a fourth: **not everything needs technology.** Some work is fixed by writing down how it's done, or by changing who does it. If someone tells you everything can be solved with a software package, be wary.

You're left with a question that deserves an answer:

> If it isn't about buying a tool, then what is it?

5. What this is not, and what it is

Here's the answer. If you take only one page from this guide, make it this one.

> This isn't about buying a specific tool or piece of software. It's about studying your business and finding your own personalised formula.

Read it again, slowly.

What it is not

The usual approach is the opposite, and it's not what this is: **"I sign up for a piece of software and adapt my processes to it."** You change how you work so that it fits the software, and your team learns to work the tool's way, not their own.

It's like buying a one-size-fits-all suit and putting on or losing weight until it fits. Against that, a made-to-measure suit: first the measurements are taken, and then the cloth is cut.

What it is

> We analyse your company, personalise the solution and connect it simply to the software you already use, and we train your team so that the way they work evolves and they can spend time thinking and doing work that really adds value for you.

Three steps, one after the other:

1. **Analyse your company.** Where time is lost, in what order and why.
2. **Personalise the solution and connect it to the software you already use.** No moving house: what already works stays.
3. **Train your team.** It's the one that's mentioned least and matters most. A solution nobody knows how to use ends up in a drawer; a team that understands what it has in its hands improves it by itself, day after day.

What it's for

Ordered from what weighs most to what weighs least:

- Your team recovers hours that today go on repeating.
- Fewer mistakes are made, and the ones that happen are seen sooner.
- And you recover the most valuable thing: time to think.

Close your eyes for a moment. Any Tuesday, eleven in the morning. The person in administration, the one with the two hours a day moving data, is on the phone with an important customer, sorting out something she never used to have time to look at. She's still herself. She's still in her post. She's doing work that used to go undone.

And you have a free hour in the morning. With hot coffee.

First, look at the road. The rest is built afterwards, to your measure.

It sounds good. But then, everything does. That's why the next chapter doesn't ask you to believe it: it shows you how it looks in three companies very much like yours.

6. Three companies like yours

Before you read, a clarification: the three stories that follow are **example stories**. The characters and companies are invented. What they describe, however, is real and achievable. And the results are modest on purpose, to make it easier for you to see how it applies to your company.

Example story 1: the components factory

It's 7:40 pm and Marcos is still in his office, with four spreadsheets open and a half-finished quote.

Marcos is the managing director of an industrial company of about 85 people that makes metal components. He's always the last to leave, and he trusts his own checking more than any software. He has a quirk: he keeps every invoice from the last ten years printed out, in ring binders, "just in case", even though they're in the management system.

Every quote means opening those spreadsheets, checking material prices, looking up lead times and writing the document. A person in the technical office takes almost a whole morning over each one. On top of that, Julián, who has been in the company for twenty years, is the only one who knows how to set up one of the machines properly. When he's away, everything waits.

He had already tried what anyone would: hiring another person for the technical office. After six months learning how quotes were prepared, that person left the job. It was the third time it had happened to him. And back to square one: the same spreadsheets, a morning per quote and Julián as the only one who knew how to set up the machine.

One day, Marcos decided to take action, but differently. He set aside an afternoon, took a sheet of paper and wrote down the path a quote follows from the moment it comes in to the moment it goes out. With that information, and with everything Julián knew finally written down, a tailor-made solution was created, connected to the software they already had. The management system wasn't replaced. There were no redundancies.

The reward came quickly and it was modest: within a matter of weeks, the technical office recovered about **ten hours a week**. And setting up that machine stopped depending on a single person. The team went from filling in quotes to reviewing the difficult ones and talking to customers.

Example story 2: the haulage company

The office phone rings for the third time before nine: "Where's my order?"

Carmen is the managing director of a freight haulage company with about 70 people. She knows every driver by name, and when there's a mess she answers the phone herself. Her small flaw: she writes everything down in a red-covered notebook she has no intention of ever giving up.

Whoever answers has to check the system, call the driver, check again and call back. Ten minutes each time. On top of that, every delivery generates a delivery note that is received, scanned, typed into the system and, at the end of the month, copied again for invoicing. Two people spend a good part of their week on that.

Carmen had already tried the usual. First she asked the invoicing team to stay a little longer at the end of the month. Then she hired one more person for the phone. It got a little better, for a few weeks. Then more orders came in and the same calls came back, the same waits and the same delivery notes typed twice.

One day, Carmen decided to take action, but differently. She asked for something very simple: for one week, every repeated call was marked with a tally stroke. With the tally marks in front of them, the whole road became visible, from the moment the lorry leaves until the delivery is

invoiced. With that information a tailor-made solution was created, connected to what they already used, and the office team learned it in a few weeks and kept fine-tuning it.

The result, without fireworks: repeated calls dropped noticeably and the two people in invoicing **gained about twelve hours a week between them**. Now they review the unusual cases, which used to be discovered late. There were no redundancies, and the person hired for the phone moved on to looking after the most important customers.

Example story 3: the agri-food company

The lorry is waiting at the dock with its engine running, and a certificate is missing.

Elena runs an agri-food company of about 120 people, more when harvest season arrives: it collects crops from several farmers, prepares them and exports them to Europe. She knows every farm by name and personally checks every important shipment. Her endearing flaw: for months she's had a cracked phone screen and refuses to replace it.

Every export needs its paperwork: documentation, certificates, delivery notes, origin data. Everything has to be correct and on time, or the goods sit stuck at the border. The record of which farm each batch comes from lives in spreadsheets updated by hand. At the peak of the season everything piles up, people stay late and the mistakes, which are always small, become expensive.

Elena had already tried the usual, season after season: bringing in temporary staff at peak time and retraining everyone from scratch. Every year, the same weeks lost teaching, the same beginner's mistakes in the certificates and, once the season was over, everything they had learned left with them.

One year, Elena decided to take action, but differently. She spent a morning, before the season began, following a shipment from start to finish with the people who prepare it. With that information a tailor-made solution was created, connected to the spreadsheets and software they already had, and the team was trained before the season.

The reward came in the following season: the administration team **handled the peak without constant overtime**, preparing each shipment went from taking hours to needing only a review, and there were fewer documentation errors. Nobody lost their job. The people who used to copy data moved on to coordinating with the farmers and the hauliers.

What they have in common

Three different companies, four things in common:

- All three had already tried the usual (more people, more hours, retraining) and it hadn't fixed the problem at its root.
- None of them started by buying anything.
- All of them looked first at the road the work travels, not at the tool.
- In all of them, the team moved on to doing something better, not to being left without a place.

And one more, which isn't visible at first sight: in all of them there was an afternoon, a piece of paper and someone who described how the company really worked.

First, look at the road.

Did you recognise yourself in any of them? Maybe only in one detail: the delivery note, the one person who knows, the seasonal peak. That detail is the thread. To pull on it, you need the one thing that can't be made up: your company.

7. Your turn: your company diagnostic

So far, the guide has been talking to you. From now on, you do the talking.

Nobody knows your company better than you. Describe it the way you would to someone who has just arrived and knows nothing: "Here, when an order comes in, this happens...". That is the easiest way, and the one that works best.

We know your time is the scarcest thing you have. That's why we won't ask you for endless forms or another meeting to fill in boxes: we've designed a page where you can tell us about your company **in your own voice, in a few voice notes, in 5 or 10 minutes**, from your phone and wherever you are.

With those voice notes we put together **your company diagnostic**: where your company is paying the invisible tax, in order, from what costs you most to what costs you least. Not a generic list: your company, in your words and with your examples.

And there's something more. Saying it out loud forces you to organise everything you've just read and apply it to your own case. It's the moment when this guide stops being one more thing you read and becomes your plan, instead of going to waste.

Ten minutes of yours. Your diagnostic, done by us.

Tell it in a voice note

Voice messages like the ones on WhatsApp. No script and **no time limit**: speak for as long as you need, the way you would to a friend who asks how work is going.

We designed it this way for a reason: so that you lose as little time as possible, and so that this doesn't go to waste or leave a bad taste in your mouth. The aim is to give you **clarity and solutions**.

The problem	The solution
You have no time for forms or another meeting.	You talk for 5 or 10 minutes from your phone, whenever and wherever you like.
Writing is tiring and always falls short.	In a voice note you say more, with less effort and in your own words.
You read a guide, you like it, and by Monday you've forgotten it.	By telling it, you apply it to your company and turn it into your plan.
You know something is going wrong, but not where to start.	You receive your diagnostic with the areas in order: from the one that costs you most to the one that costs you least.

Three things worth knowing:

- **The better you explain it, the better your report will be.** A five-minute voice note with examples is worth more than a five-second one.
- **For each question you can record several voice notes** and listen to them before moving on. If you forget something, record another.
- **If you prefer to write, you can.** Each question has its own text box. Even so, people usually say more, and more naturally, by voice.

We ask for your email at the end, once you've already told us the important things, because this guide is a gift and the report has to be sent somewhere.

An important request

Please don't mention the names of specific employees or customers, and don't share sensitive data. There's no need. Tell us about **situations**: "a person in administration copies every order", not "María copies every order". The situation is more than enough.

Before you record: your worksheet

This is the first step, and it's a small one. Take the paper and write down three tasks in your company that take someone's time. They don't have to be the biggest: the first ones that come to mind will do. The first row is already filled in so you can see how.

Process or task	Who does it (job title, not name)	How much time per day or per week
1. Looking at the orders that arrive by email and typing them by hand into the ERP	Person in administration	2 h a day
2.		
3.		

When you've finished, tick:

☐ I've written down my three processes.

☐ I've thought about how much time they take.

☐ I've avoided the names of people, customers and sensitive data.

And now a one-line plan, so it doesn't stay an intention: **"If on Thursday at 10 I have ten minutes, then I'll record my first voice note."** In that sentence write your own day and your own time, and put it in your diary like any other meeting. It's ten minutes so that your company stops paying the invisible tax and so that, two months from now, nobody pulls you away from the table on a Saturday.

The questions

These are the questions you'll find at the link and that you'll answer by voice or in writing. There are five screens, and 5 or 10 minutes is more than enough (if you want to go on longer, go ahead):

Tell my story →

To help you get your head ready, this is what's on each screen:

1. **Your company in data.** How many of you there are, what you do, where you are and what software you use. Almost all of it with one click.
2. **Your company from the inside.** Which departments you have and who runs each one.
3. **Your day to day.** What has to pass through your hands, what only one person knows, the data that gets copied by hand, the questions that keep being repeated and the meetings that decide nothing.
4. **Your problems.** What weighs on you most today and the one thing you would fix this month.
5. **Your contact details.** So we can send you the report.

You don't need to answer point by point: on each screen you can tell it all in one go in a single voice note.

When you have your worksheet in front of you, start here:

Tell my story →

One practical detail: voice notes can't be deleted once they're recorded, so listen to them before moving on and, if you want to change something, record another. And the small print, which is worth reading:

> Small print: the voice notes and written answers you send us, together with your email, are stored for the sole purpose of collecting your information and generating a personalised report for you. We ask you not to mention names or sensitive data of employees or customers. You can ask us to delete your data by writing to ag@almudenagazquez.com. More information in the privacy policy at almudenagazquez.com.

When you've finished, the natural question remains: what do you get in return?

8. What you'll receive

You'll receive a **personalised report**.

Inside you'll find the areas of your company where it would make most sense to work, **in order**: first the ones that take away the most time, then the next ones. In your words and with your examples, not with generic phrases. It's what anyone who sat down with you for an afternoon to look at your company calmly, with a piece of paper, would do.

There's one piece this guide can't give you: which of your processes to start with. The report supplies that.

What you will **not** find:

- No promises about timescales.
- No guaranteed savings: you've already seen that what it costs is not what you save.
- No list of software to buy.

The report is a snapshot. A well-taken snapshot of the areas that deserve attention. With it, you decide: keep it, show it to your team or get to work on your own.

Now imagine a Monday a few months from now. You arrive, and somebody has already solved what used to pull you away from the table on a Saturday. Your team works without all the copying. And you have a free hour in the morning to think about what really matters.

A calm question, no drama: a year from now, will your Monday at 8:07 pm be different from today's, or the same? Looking at your company for one afternoon costs a piece of paper and a few voice notes, and it's the cheapest way to find out where to start if you want to stop paying the invisible tax.

One last piece of the puzzle remains: what happens after the report.

9. The next step

Nothing has been sold so far, and now it's time to speak clearly about what we do, without disguising it as something else.

There is no product to buy. No entry fee, no ticket, no course. There is a **solution**: what chapter 5 described exists and gets done.

The step is a **meeting**. One hour, one to one, free of charge. Almudena arrives with all the information from your diagnostic, built from your voice notes and your examples, and with your report. Because this meeting isn't about starting from zero: Almudena has already done the work.

In that hour, with everything we already know about your company, we show you how it can be solved: quickly and simply, with the same team you already have on the payroll, but working in a far more efficient way.

To book it, first answer a few brief questions. They let us link your report to your meeting: that way we know the diagnostic you sent us and the hour you book belong to the same person, and we arrive with everything prepared. Then choose a day and time:

Book my 1-hour meeting →

That hour is for seeing with your own eyes whether what this guide describes makes sense in your company. And if it doesn't, that's fine: you keep the report and a useful conversation, and there's nothing to cancel because you haven't signed up for anything.

How it's approached

If you decide to go ahead, the work is done **in stages**: first what takes away the most time and gives a return soonest; then the next thing. That way, if you want to continue, each improvement could be paid for with what's saved on the previous one. We say "could" on purpose: it isn't guaranteed, because it depends on each company. But that is the approach: that each step should stand on its own.

Who you work with

You won't be working with one person on their own. Behind it there's a **multidisciplinary team**, young and proactive, with years of experience in programming, in developing software that is used by subscription and accessed over the internet (what the industry calls SaaS), in marketing, in digital brands and in the whole online world. Some build the solution, others connect it to your software and others help your team get the most out of it.

Leading the relationship with you is Almudena Gázquez. She spent ten years on the management team of an industrial company, analysing the bottlenecks that held back growth and proposing improvements to the leadership. The credit for that company's growth belongs to the whole team of employees, working together; Almudena was project director and head of strategic business development, the strategy that allowed much lighter, more scalable growth.

And she saw something that matters a great deal today: ten years ago, copying, searching and repeating by hand made complete sense, because there was no other way to do it. Today there is. That's why Almudena now helps other managing directors improve their processes so they stop losing money on tasks that no longer make sense, with the support of a very solid technical and IT team, specialised in developing systems with AI.

You're in the same boat: your team, hers and you. And everything is better when you're not alone. This too.

And when we finish, your company doesn't depend on us for anything: it remains autonomous, but far more efficient. You'll have us at your disposal for future improvements, because our aim is to keep a good long-term relationship, but it's important that you know: you won't be tied to any monthly fee with us. **What we develop for you is yours.**

An extra

While you wait for the report, if you'd like an idea of how many hours are going, there's a lost-hours calculator. It takes **2 minutes** and you receive a PDF report by email:

Calculate my lost hours →

It doesn't replace your diagnostic. It complements it: it gives you a first number, and your voice notes allow us to do a much more accurate analysis of your particular situation and create a report of solutions to address it.

To finish

Think of the Monday from before: 8:07 pm, the fluorescent light, the Excel file. And now of another Monday, in the same office at six in the evening, empty because everyone has gone home on time, you included.

Between one and the other there's an afternoon, a piece of paper and a decision: to start by looking.

First, look at the road.

Thank you for reading this far.

We value your time.
